

Intravenous Vitamin C

High Dose Vitamin C IV Therapy involves the intravenous infusion of high doses of vitamin C (ascorbic acid). The initial dose may be 15 or 25 grams and, if this is well tolerated which is almost always the case, the dose is increased to 50 grams. In some cases the dose may be increased to 75 or 100 grams, or more.

High Dose Vitamin C IV Therapy is well tolerated and very effective for a wide range of health problems. It can resolve both acute and chronic bacterial and viral infections, neutralize a wide variety of toxic substances and is a very safe and effective detoxifier of heavy metals. Recently, High Dose Vitamin C IV Therapy has been proven to improve outcomes for cancer patients.

An enormous amount of scientific literature on vitamin C has been written over the past century, much of it from the most esteemed research centers. According to Thomas E. Levy, M.D., J.D, in his excellent book *Vitamin C, Infectious Diseases & Toxins*, "there are very few human diseases or medical conditions that are not improved to at least some degree by the regular dosing of optimal amounts of vitamin C. There is only rarely a good reason for not immediately giving any patient large doses of vitamin C..." He continues. "Ultimately, it should become apparent to the reader that Vitamin C is the single most important nutrient substance for the body..." and "the scientific literature... clearly shows the vast clinical superiority of intravenous vitamin C over any other form of vitamin C administration. Often a significantly smaller dose of intravenous vitamin C, compared to an oral administration, will promptly result in the clinical resolution of an infectious disease."

While relatively small amounts of vitamin C can prevent scurvy, much larger amounts are needed to optimize health. A very simple and wise approach is to always give vitamin C on a daily basis and always give enough.

High Dose Vitamin C IV Therapy is a specific, medical procedure that must be performed by properly trained, medical professionals in accordance with strict protocols. When properly performed, High Dose Vitamin C IV Therapy is comfortable, safe and effective. High Dose Vitamin C IV Therapy has a cumulative effect so that each treatment builds on and enhances the effects of previous treatments. For acute infections, frequent treatment may be necessary initially.
