

Parasite Treatment

Parasite Treatment involves the diagnosis and elimination of a wide variety of human parasites that undermine health and cause or contribute to disease. The Center for Disease Control (CDC) conservatively estimates that at least 30% of Americans have some form of parasite infection. Other experts put that rate at up to 70%. Whatever the level of occurrence, parasite infections are far more common than most people and doctors realize. And, in addition to being the cause of most digestive complaints, many types of parasites have the potential to systemically undermine a person's ability to regain their health, no matter what the condition.
